

Assignment 3 - Scientific Computing by MnP

Submission deadline : 11:59 pm 28th July 2020

Question 1

Solve the differential equation using odeint on python and plot the graph of y vs x.

$$dy/dx = \cos(x) + x^2$$

Take $y(0) = 0$ and $x = \text{linspace}(0, 10, 1000)$

Question 2

Time for a bit of SciFi in the SciComp course!

We'll be modelling a Zombie apocalypse. The system is modelled by the following equations

$$\begin{aligned} dS/dt &= P - BSZ - nS \\ dZ/dt &= BSZ + GR - ASZ \\ dR/dt &= nS + ASZ - GR \end{aligned}$$

- S: the number of susceptible victims
- Z: the number of zombies
- R: the number of people "killed"
- P: the population birth rate
- n: the chance of a natural death
- B: the chance the "zombie disease" is transmitted (an alive person becomes a zombie)
- G: the chance a dead person is resurrected into a zombie
- A: the chance a zombie is totally destroyed

Take the following values for the constants:

- $P = 0$
- $n = 0.0001$
- $B = 0.0095$
- $G = 0.0001$
- $A = 0.0001$

Take the initial populations as: $S = 500$, $Z = 0$ and $R = 0$

Plot for the first 5 days after the zombie apocalypse starts: $t = \text{np.linspace}(0, 5, 1000)$

Question 3:

Model a simple vertical spring-mass system and plot its position and velocity as a function of time.

The time should span from 0 to 10 with 10000 sample points in between.

Take $k = 2.5$, $m = 1.5$, $g = 9.8$ (all in SI units) and the initial position and velocity to both be 0.

Hint:

You will be solving a second order differential equation. To do this consider the following:

$$V = \begin{bmatrix} x \\ \dot{x} \end{bmatrix} \quad \dot{V} = \begin{bmatrix} \dot{x} \\ \ddot{x} \end{bmatrix}$$
$$\dot{V} = \begin{bmatrix} V[1] \\ f(V[0], V[1]) \end{bmatrix}$$

Write the function to integrate the differential equation for this vector v .
